The UC Davis Math PhD program is structured to guide students through a comprehensive and challenging academic journey, culminating in original research. The curriculum is designed to build a strong theoretical foundation and foster advanced analytical and problem-solving skills. Students progress through several key stages, each marked by significant academic and research milestones.

Core Coursework and Qualifying Exams

The initial years of the program are typically dedicated to intensive coursework. Students are expected to complete a set of core graduate-level courses that cover fundamental areas of mathematics such as real analysis, abstract algebra, and functional analysis. After completing the core

coursework, students will face comprehensive qualifying examinations, often referred to as "qualifying exams" or "comprehensive exams." These exams are designed to test a student's mastery of the core material and their ability to think critically and analytically about mathematical concepts. Passing these exams is a crucial step, signifying readiness to proceed to independent research.

Research Specialization and Advisor Selection

Once the qualifying exams are passed, students transition to a more research-focused phase. This involves identifying a specific area of mathematics for specialization and selecting a faculty advisor. The advisor plays a pivotal role in guiding the student's research, providing mentorship, and helping to shape the direction of their dissertation. Students are encouraged to explore different research areas through seminars and by interacting with faculty whose work aligns with their interests. This period is about finding a research question that is both interesting and feasible for doctoral-level investigation.

The Dissertation and Defense

The capstone of the UC Davis Math PhD is the dissertation. This is a substantial piece of original research that makes a new contribution to the field of mathematics. Under the guidance of their advisor and dissertation committee, students will conduct in-depth research, develop new theorems or methods, and rigorously document their findings.
